Eriosuchina Eriosuchina is an extinct order of crocodyliforms. Only two genera and four species of early Eryosuchids are known. A review of the diversity of Eryosuchids has been published by Carpenter, Samuel & Naish (2007). The order Eryosuchiformes was named for the genus Eryosuchus, which is the most basal known crocodyliform, and all other genera are classified within the Eryosuchina. According to Carpenter, et al., the Eryosuchina is the sister group of the Crocodyliformes, and a close relative of the theropods. History of discovery Fossils that may belong to the order Eryosuchina have been discovered from Europe, the Middle East and North Africa. A review of the diversity of Eryosuchids has been published by Carpenter, Samuel & Naish (2007). Taxonomy The first genus of Eryosuchina to be named was Jurecekie in 1932. The oldest known Eryosuchid fossils date to the Late Triassic, and the known species have been found in the latest Triassic. Early Eryosuchids were almost completely aquatic, but as the Triassic-Jurassic boundary approached, they became terrestrial. The order Eryosuchina was named by Franz Nopcsa in 1932 for the genus Eryosuchus, and all other genera are classified within the Eryosuchina. Description Eryosuchids were large, aquatic animals with long, narrow snouts and long, narrow, heavily armoured tails. They are believed to have been either territorial or migratory, feeding on fishes and other marine animals. Eryosuchids had skin completely covering the limbs, forelimbs and tail, and had beaks that were longer than their bodies. Phylogeny Eryosuchus Eryosuchus is the most basal known crocodylian, a genus of carnivorous, nearly aquatic crocodyliforms. Eryosuchus was a very large animal, f678ea9f9e
